## CMA 470 Refrigerated Fraction Collector

The CMA 470 Refrigerated Fraction Collector is specifically designed to collect microliter volume fractions typical of microdialysates. It has thermoelectric cooling down to +6 °C and the fractions can be collected in sealed vials. Both of these are important considerations for the prevention of evaporation and chemical degradation. It is possible to collect fractions as small as 1 µL at the bottom of each vial. The capacity of the collector is 64 vials of 300 µL each or 40 vials of 2 mL each. Equipped with a quadruple assembly the CMA 470 can collect fractions from up to four probes simultaneously. There is also an option to collect samples in open vials.

The collection takes place in a temperature controlled magazine where the vial cassettes rotate. The cannulas are in fixed vertical position to not influence the flow. Although it is not necessary to connect the system to a computer for normal operation, the CMA 470 Refrigerated Fraction Collector is equipped with a RS232 and a USB port to communicate with other instruments or for computer-control the system in advanced operations.
