

CMA 111 Syringe Selector

- instantly switch between syringes
- prevent introduction of air bubble
- no interruption of flow

The CMA 111 Syringe Selector allows automated or manual switching between one of three perfusion lines (syringes) and a microdialysis probe. This makes it possible to change different solutions instantaneously without any risk of introducing air bubbles into the microdialysis probe.

The CMA 111 Syringe Selector is motor-driven and powered from the CMA 400 Microinjection Pump.
